This prolein is encoded by the novel human fchd605 gene (ser-19447) that is up-regulated in monocytes treated with oxidiscut low density lipoproteins that simulate the conditions under which foam cells develop during atherogenesis. The protein has sequence similarity to the mouse gly96 gene and to EST T49532. Novel fchd510, fchd540, fchd602 and fchd605 genes (see T94467-71) provide a lingerprint for the study of cardiovascular diseases, including atherosclerosis, ischemia/reperfusion, hypertension restends and arterial inflammation, Methods are provided for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses methods for the treatment and diagnosis of cardiovascular diseases by novel human genes which are differentially expressed in different cardiovascular disease states. Compositions which can modify ToF-beta signalling pathway are identified by screening.

These are used therapeutically to treat fibroproliferative and oncogenic disorders, especially TGF (Transforming growth factor)-beta related disorders, including diabetic retinopathy, artheroscierosis, pancreatic cancer, anglogenesis, inflammation, fibrosis, tumour growth and cancer, anglogenesis, inflammation, fibrosis, tumour growth and cancer, unjoquenesis, inflammation, fibrosis, tumour growth and density lipoprotein) can be used to design cardiovascular disease treatment strategies. Depending on whether the up-regulation has a pathogenic or protective effect treatment methods can be designed to increase or decrease the activity of the protein product of the gene.
                                                                                                                                                                                                                                                                                                                                   ..

                                                                                                                                                                                                                                                                                                                         õ
                                                                                                                                                                                                                                                                              4
                                                 This sequence shows the central portion, including the C-terminus of the alpha-helix region and some of the proline-rich region, of strand but a surface protein A (PspA) of Streptococcus pneumoniae Strain Dbl5. Comparison of the N-terminal and central regions (W1453-57 and W1452-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several families based on sequence homologies. PspA polypeptides, or fragments of them, can be used in vaccines to protect animals against S. pneumoniae infection and hence for the prevention of diseases such as ottlis media, manipolitis, bacteraemia and pneumonia. The sequence of the 3' half of the PspA alpha-helical region and the immediate 5' tip of the coding sequence are likely to be the critical sequences for predicting PspA cross-reactions and vaccine
                                                                                                                                                                                                                                                                                                                    100 tpapapapapapaptpeapapapapkpapapkpapapk-----papapkpapa 147

                                          This sequence shows the central portion, including the C-terminus of the alpha-helix region and some of the proline-rich region, of pneumococcal surface protein A (195A) of Stroptococcus pneumoniae Strain Ef6796. Comparison of the N-terminal and central regions (W14533-57 and W14562-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several families based on sequence homologies. PspA polypeptides, or families based on sequence homologies. PspA polypeptides, or fragments of them, can be used in vaccines to protect animals against S, pneumoniae infection and hence for the prevention of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 5
                                                                                                                                                                                   This sequence shows the central portion, including the C-terminus of the alpha-helix region and some of the proline-rich region, of pneumococcal surface protein A (PspA) of Streptococcus pneumoniae strain Bg9163. Comparison of the N-terminal and central regions (W14533-57 and W14562-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several families based on sequence homologies. PspA polypeptides, or Iragments of them, can be used in vaccines to protect animals against 5. pneumoniae infection and hence for the prevention of discases such as otitis media, meninglis, bacteraemia and pneumonia. The sequence of the 3' half of the PspA alpha-helical region and the immediate 5' tip of the coding sequence are likely to be the critical manner::...

This sequence shows the central portion, including the C-terminus of the alpha-helix region and some of the proline-rich region, of pneumooccal surface protein A (PspA) of Streptococcus pneumoniae strain 0922134c. Comparison of the N-terminal and central regions (M1453-57 and W14562-91) of PspA polypeptides from different pneumooccal strains can be used to divide the strains into several fragments of them, can be used to divide the strains into several fragments of them, can be used in vaccines to protect animals against S. pncumoniae infection and hence for the prevention of diseases such as ottism medial of the PspA alpha-helical region and the immediate 5' tip of the coding sequence are likely to be the critical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      98 etpapapapapapek----paekpapapapapekpapapek----paekpae 139

strain Bg9739. Comparison of the N-terminal and central regions. (W14533-57 and W14562-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several families based on sequence homologies. PspA polypeptides, or fragments of them, can be used in vaccines to protect animals against S. pneumoniae infection and hence for the prevention of diseases such as ottis media, meningitis, bacteraamia and pneumonia. The sequence of the 3' half of the Coling sequence are likely to be the critical sequences for predicting PspA cross-reactions and vaccine
                                                                                                                                                                                                                                                                                                                                                       101 tpapapapapapaptpe----apapapapapkpapa-----pkpapapkpa 142

a mouse brain cDNA library. Neural Menai contains an exou that introduces 244 amino acids between amino acids 238 and 239 of mammalian Ena (Mena, see W37148). Two other isoforms, neural Mena++ (see W37152), are also disclosed. Unlike Mena, neural Mena isoforms exhibit neural tissue-specific distribution. Based on the disclosed Mena and Ev! genes (see also V02996-97) and proteins (see also W37148-49), a variety of methods and compositions are provided for screening, isolating and characterising endogenous and exogenous factors, drugs and therapeutic agents useful to evaluate and/or control cytoskeletal dynamic events involved in normal and abnormal cell morphology, adhesion, mothlity, growth and/or differentiation. A method of detecting a modulator of Mena activity/expression is
                                                                                                                                                                                                                                                                                                                                                                                                                                                57 GHRKRSRRYLLYPRVVRRQLPVEEPNPAKRLLFLLLTIVFCQILMAEEGVPAPLPPEDAPN 116

This protein comprises novel murine neural Mena++. Its amino acid sequence was deduced from a CDNA clone obtained from a mouse brain cDNA library. Two other isoforms, neural Mena+ (see W37151) and neural Mena+ (see W37152), are also disclosed. Unlike mammalian Ena (Mena, see W37148), neural Mena isoforms exhibit neural isoforms can expecific distribution. Based on the disclosed Mena and Evlagenes (see also W02996-98) and proteins (see also W37148-49), a variety of methods and compositions are provided for screening,
                                                                                                                                                                     isolating and characterising endogenous and exogenous factors, drugs and therapeutic agents useful to evaluate and/or control cytoskeletal dynamic events involved in normal and abnormal cell morphology, adhesion, motility, growth and/or differentiation method of detecting a modulator of Mena activity/expression is

                                                                                                                                                                                                                                                                                                                                                                                                                     ;
9
This protein comprises novel murine neural Mena++. Its amino acid sequence was deduced from a cDNA clone obtained from a mouse brain contained from a mouse brain to contain forary. Two other isoforms, neural mena+ (see W37151) and neural Mena+ (see W37151) and neural Mena+ (see W37153), are also disclosed. Unlike mammalian through see W37148), neural Mena isoforms exhibit neural classue-specific distribution. Based on the disclosed Mena and Evl genes (see also V02996-98) and proteins (see also W37148-49), a sizelaty of methods and compositions are provided for screening, variety of methods and compositions are provided for screening, cluds and therapeutic agents useful to evaluate and/or control cytoskeletal dynamic events involved in normal and abnormal cell morphology, adhesion, motility, growth and/or differentiation.

ligand dependent manner to induce gene expression can be identified using the method of the invention. The specification describes a method for identifying compounds that modulate a nuclear receptor. The method comprises incubating a polypeptide containing a ligand-binding region of nuclear receptor with test compound in presence of second polypeptide containing the nuclear receptor-binding part of a IMG protein, and detecting any alteration in binding between the two polypeptides. The method is useful for identifying potential antiproliferative, anti-inflammatory, antipsoriasis and anticancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a high mobility group (HMG)-R protein. HMG sequences that interact with retinoic acid receptors (RARs) in a ligand dependent manner to induce gene expression can be identified using the method of the invention. The specification describes a method for identifying compounds that modulate a nuclear receptor. The method comprises incubating a polypeptide containing a

                                                                                                                                                                                                                                                      This protein is encoded by gene 036 (see T91708), which was identified by differential display analysis as being expressed at a ligher level in normal colon tissues than in cancerous colon tissues. Gene 036 is a candidate tumour suppressor gene. A correlation was found between an increase in the expression level of gene 036 and a decrease in a colon cell's tumour potential. Hence, methods that increase the level of expression of gene 036 may inhibit or slow the progression to tumours and cancer, e.g. colon cancer. The 036 protein is used in claimed methods for treating a patient suffering from a disorder associated with

Kas and Sos form a tight complex. Sos does not impode the binding sites for the nucleotide base and the ribose of GTP or GDP and thus the Ras-Sos complex maintains a structure that permits nucleotide release and rebinding. The crystals are used for the determination of the atomic coordinates of the complex to a resolution of more than 5.0 Angstrom. The crystals, or a dataset comprising the three-dimensional coordinates obtained from the crystals, is useful for identifying an agent that stabilizes the Ras-Sos complex. The crystals are also useful for identifying agents that inhibit the formation of Ras-Sos complex. Ras and Sos fragments are useful for growing a crystal of a protein-ligand complex. Agents that stabilize
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes a crystal complex comprising at least a Sos contacting region of a Ras protein and at least a Son of sevenless (Sos) protein catalytic region fragment, that effectively diffracts

member - PEA3-beta. The gene was isolated from a HepG2 cell line cDNA library. The probe for the screening was prepared by reverse transcription on HepG2 mRNA followed by PCR using primers 091770-1, to produce a probe of 170-200 bp. The screening isolated the full length sequence of the transcription factor. The gene was inserted into protein in E.coli and COS7 cells, respectively. The FTS transcription factor has specificity for and is activated by ras. It is useful as a reagont in studies for the elucidation of the mechanism of cancer cell multiplication or polyoma virus transformation of cells.

/note="Organ: kidney; Vector: pr7:3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I: Site_2: Eco RI; Ist strand cDNA was primed with a Not I - oligo(dT) primer, double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), diagested with N:1 I and cloned into the Not I and Eco RI sites of the modified pr7:73 vector. mRNA source: 2 pooled kidneys. Library went through one round of normalization. Library constructed by Bento Soares and M. Fatima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hillier, L., Clark, N., Dubuque, T., Elliston, K., Hawkins, M., Holman, M., Hultman, M., Kucaba, T., Le, M., Lennon, G., Marra, M., Parsous, J., Rifkin, L., Rohlfing, T., Soares, M., Tan, F., Trevaskis, E., Waterston, T., Walliamson, A., Wohldmann, P. and Wilson, R.

by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, E, F, H, I and J to RNA polymerase II holoenzyme. Fraction TFIID, has been shown to contains a TBP and other TAFs. Purification of ItlD and separation of its components reveals T proteins ranging in size from 30.250 kD. Serum raised against the TFIID fraction allowed cloning of the correspecies from lambda-gtil expression libraries.

nucleic acids encoding them, are used to modulate transcription, including transcription initiation. TAFS are nuclear proteins involved in RNA polymerase I, II and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typically a protein like TBP or another TAF, an activator,

O
surface molecule 4F2. Antisense DNA or RNA, antibodies, antibody fragments, and peptide and non-peptide antagonists to LA11 are useful as anticancer agents. The present sequence encodes human LAT1, which is specifically claimed in the present invention.

This is the nucleotide sequence encoding the Drosophila TATA-binding protein (TBP) associated factor (TAF) designated TAFI160. The protein is a component of the TFI1D fraction required for reconstituting kNA polymerase II in vitro transcription activity. The encoded protein has an estimated mol. wt. of 60 kD by SDS-PAGE.
The invention relates to purified proteins involved in transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screen for cpds. that bind human TATA-binding prolein associated factor - by testing ability to bind to polypeptide fragments of the factor, useful as (ant)agonists of transcription factors involved in

The present invention describes a cell surface protein which is an L-type amino acid transporter-1 (LAT1), which mediates the transport of neutral amino acids, leucine, isoleucine, phenylalamine, methionine, tyrosine, tryptophan, valine and histidine, into the cell independently of sodium ions. The LAT1 protein conjugates with the cell membrane

A00010 to A02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting flafferentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of

This cDNA sequence includes an open reading frame encoding rat. islet-brain 1 (IBI, see W80601), a transcriptional activator that is involved in the control of the GLUTZ and insulin genes by interacting with homologous cis-regulatory elements of the GLUTZ and insulin gene promoters. IBI CDNA was isolated from a rat differentiated insulinoma INS-I CDNA was isolated from a rat differentiated insulinoma INS-I CDNA was isolated from a rat care of the GLUTZ promoter. IBI is abundantly expressed in the parcreatic islets in the brain. Human IBI polynucleotide (see W80602) are also claimed. IBI colypeptides, nucleic acids, agonists and antagonists can be used in the Irealment or diagnosis of diabetes, neurodegenerative discoders or cancers, to inhibit cells from undergoing apoptosis, to treat dementia, parkinsonism, Alzheimer's disease, neuronal disabilities
IBI; islet-brain 1; transcription factor; rat; diabetes; dementia; Parkinson's disease; Alzheimer & disease; epilepsy; neuroblastoma; glioblastoma; apoptosis; cancer; autoimmune disease; systemic lupus erythematosus; myocardial infarction; ischaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  such as speech disorders and memory alteration, autoimmune diseases affecting the CNS such as systemic lupus erythematosus, diabetes, heart diseases such as myocardial infarct and ischemia or brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated transcription factor islet-brain 1 - used to develop products for treating e.g. diabetes, neurodegenerative disorders, cancers, autoimmune disease, heart disease or epilepsy

Sequences V69704 to V69715 represent introns of the gene encoding an equilibrative nucleoside transport protein (iENTP), which is insensitive to introbency] mercaptopurine riboside (NBMPR). Cells transformed with a construct containing the iENTP nucleic acid can be used to produce the protein recombinantly. iENTP is used to identify specific ligands (preferentially methyiral and antitumnour nucleoside analogues that are preferentially transported into cells) and to raise antibodies. Cells in the iENTP provides all available transport activity are used; contents provides all available transport activity are used; contents protectial drugs). Fragments of the iENTP nucleic acid are used, as probes, primers, antisense molecules, and ribozymes for therapy or diagnosis, and knockout mice in which both alleles encoding iENTP contain an inactivating defect are also useful for drug screening. Cells that have been transduced with iENTP nucleic acid ex vivo are used particularly, for cancer chemotherapy. Vectors in which the iENTP gene
                                                                                                                                             Equilibrative nucleoside transport protein; iENTP; NBMPk; transport; nitrobenzylmercaptopurine riboside; antiviral; antitumour; screening; inhibitor; drug; knockout mice; cancer; chemotherapy; gene therapy; adenosine deaminase; factor VIII; intron; ds.

This invention describes novel polypeptide fragment sequences. (I) and their encoding nucleic acids (II) which are highly expressed in normal bladder tissue and have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for the treatment of bladder tumours, to directly treat this form of cancer (including expression from gene therapy vectors), or are used in a preparation for cancer trealment. (I) is also used for the generation of specific antibodies. (II) are identified by assembling ESTS (expressed sequence tags) from a particular comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, and therefore reduces the number of fallures because of ESTS from different libraries crepresenting different parts of the same unknown gene distorting the estimated frequency of occurrence in a particular itssue. 242122-242248 cepters of in patterns in the contract of includer tissue condary inbrary which encode the protein fragments represented in y60329-y60591.
                                                                                                                                                                                                                                                                                                                                                                                                                Dahl E;
